** Difference between high and low frequency elevations where greater than 1'.

** Shoaled Soundings per Quarter per Reach.

** High frequency (20 kHz) survey data represents the first signal return at a sounding location and may not be the true bottom. If the "T" flag is present, the sounding (20 kHz) survey data normally penetrates through this "T" flag layer to depict channels of consolidated material. Low frequency soundings may vary depending on channel conditions and bathymetry settings.
