

Distribution Liability: The data represents the results of data collection/processing for a specific US Army Corps of Engineers activity and indicates the general existing conditions. As such, the data and the recipient accepts and uses them with the express understanding that the US Government makes no warranties, expressed or implied, regarding the accuracy, reliability or completeness of the data or information and the data furnished. The United States shall not be liable under no duty whatsoever to any person by reason of any use made of the data or information furnished.

Data Constraints: Hydrographic survey data is subject to change rapidly due to several factors including but not limited to dredging activity and natural shoals and scouring processes. The US Army Corps of Engineers shall not be liable for any damage resulting from the use of this data.

Disclaimer: This data is intended for U.S. Army Corps of Engineers internal use only. It is not to be distributed outside the Corps of Engineers without prior approval. The data is to be used for engineering purposes only and is not to be used for navigation.

MISSISSIPPI RIVER - B.R. TO GULF  
GRANADA RECON  
MR\_10\_GRA\_20180522\_CS  
22 May 2018

## NOTES:

Horizontal Coordinate System: North American Datum of 1983 (NAD83), projected to the State Plane Coordinate System (SPCS), Louisiana South Zone. Distance units in U.S. Survey Feet.

Vertical Datum: Soundings are shown in feet and indicate depths below Low Water Reference Plane 2007 (NGVD). Distances on the Mississippi River, above and below Head of Passes are shown at 1 mile intervals.

The location of navigation aids are base on and provided by the U.S. Coast Guard and USACE crew. 2010 Aerial Photography data source: NAIP, USDA-FSA-APFO Aerial Photography Field Office.

Reference is N.O.A.A. Navigation Chart No. 11370.

\*\* Shoal sounding per Quarter per Reach.

\*\*\* High frequency (200 kHz) survey data represents the first signal return at a sounding location and will include suspended solids, known as "fluff", if present. Low frequency (20 kHz) survey data normally penetrates through this "fluff" layer to depict elevations of consolidated bottom material. Low frequency accuracies may vary depending on channel conditions and fathometer settings.
