 ** Shoalest Sounding per Quarter per Reach.
 *** High frequency (200 kHz) survey data represents the first signal return at a sounding location and will include suspended solids, known as "fluff", if present. Low frequency (24 kHz) survey data normally penetrates through this "fluff" layer to depict elevations of consolidated bottom material. Low frequency accuracies may vary depending on channel conditions and fathometer settings.

DISCLAIMER: The data represents the results of data collection processing for a specific US Army Corps of Engineers project. The data is not intended for use in any other project, and is only valid for its intended use, control, time and accuracy specifications. The user is responsible for the results of their use. The application of the data for other than its intended purpose is not warranted.

DATA CONTAINS: Hydrographic survey data is subject to change due to several factors including but not limited to dredging, sedimentation, and other natural processes. The US Army Corps of Engineers does not warrant the accuracy of the hydrographic conditions when developed after the date of the survey. Product maintainers should not rely solely upon it.
