** Shoalest Sounding per Quarter per Reach.

*** High frequency (200 kHz) survey data represents the first signal return at a sounding location and will include suspended solids, known as "fluff", if present. Low frequency (24 kHz) survey data normally penetrates through this "fluff" layer to depict elevations of consolidated bottom material. Low frequency accuracies may vary depending on channel conditions and fathometer settings.

DISTRIBUTION LIABILITY: The data represents the results of data collection for a specific US Army Corps of Engineers project and is only valid for its intended use, content, time and accuracy specifications. The user is responsible for the results and accuracy of the data. The application of the data for other than its intended purpose is at the user's risk. The user assumes all liability for any use of the data. The US Army Corps of Engineers does not accept responsibility for changes in the hydrographical conditions which develop after the date of the survey. The user assumes all liability for any use of the data for other than its intended purpose.
