*** High frequency (200 kHz) survey data represents the first signal return at a sounding location and will include suspended solids, known as "fluff", if present. Low frequency (24 kHz) survey data normally penetrates through this "fluff" layer to depict elevations of consolidated bottom material. Low frequency accuracies may vary depending on channel conditions and fathometer settings.

Distribution liability: The data represents the results of data collection processing by a specific US Army Corps of Engineers activity and reflects the general existing conditions. Such data is not necessarily survey grade or suitable for engineering specifications. The user is responsible for the results of any use of the data for other than its intended purpose.

Data Constraints: Hydrographic survey data is subject to change rapidly due to several factors including, but not limited to dredging operations, subsidence, and new or changing bathymetric features. The user is responsible for keeping the data current by consulting the latest survey data available.
