** Shoalest Sounding per Quarter per Reach.

*** High frequency (200 kHz) survey data represents the first signal return at a sounding
 location and will include suspended solids, known as "fluff", if present. Low frequency (24 kHz)
 survey data normally penetrates through this "fluff" layer to depict elevations of consolidated bottom
 material. Low frequency accuracies may vary depending on channel conditions and fathometer
 settings.

DISCLAIMER
 The data represents the results of data collection processing by a specific US Army Corps of Engineers activity and reflects the general existing conditions as such. The user is responsible for the results of any use of the data for other than its intended purpose. Hydrographic survey data is subject to change rapidly due to several factors including but not limited to dredging operations, changes in river bed materials, and changes in the hydrographical conditions which develop after the date of publication. The user is advised to use the most recent data available. The information depicted on this map represents the results of a survey conducted on the date indicated and can only be considered to represent the general conditions at that time.
